

Visual Basic Program Assignment LOOP

You need to write a program that asks a teacher how many students they have in their class. Once this is entered the program will present an inputbox for each student for you to enter the score. Once every score is entered the program will give the class average.

Example of an inputbox

```
X = inputbox("Enter the Test Score")
```

When this is run an input box will pop up and ask the question. In this case it will store the answer in the variable X.

The loop that you choose needs to run as many times as the number of students entered.

Within the loop you will need to use an accumulator variable to sum up all of the entries. This type of variable is in the handout packet The Repetition Structure(Looping) that you have.

Once the scores are entered the program will leave the loop and calculate the average for the test and display it.
